BUYER'S GUIDE 09/2021**

powercoil®

wire thread insert system

PowerCoil Wire Thread Inserts strengthen tapped threads in light weight parent materials such as aluminium. They are helically wound inserts made from high quality chromium nickel stainless steel with a diamond shaped cross section.

PowerCoil inserts are used in OEM applications in a wide range of industry sectors including aerospace, automotive, military and electronics. They are inexpensive when compared to other inserts and simple to install, yet are extremely tough, wear resistant and corrosion resistant.

Most importantly, PowerCoil inserts allow the stress loading from the bolt or similar threaded part to be more evenly distributed over the threads in the parent material.

In addition to PowerCoil standard 'free running' inserts, 'screw locking' inserts are also available. These inserts have polygonal grip coils

within the length of the insert which exert radial pressure on the male thread, thereby gripping the bolt and preventing it from loosening under vibration or impact.

In addition to stainless steel, PowerCoil inserts can be made from Phosphor Bronze, Inconel or Nimonic 90 depending on the application. They can also be supplied with different surface finishes and coatings including cadmium, silver and zinc plating and dry film lubricant.

A complete range of Screw Thread Insert (STI) taps are available as well as low, medium and high volume installation tools and a wide range of individual and workshop repair kits. For further information we recommend you consult the technical pages in this guide, the PowerCoil website: www.powercoil.com.au or call your customer service representative.

loksert®

Loksert solid keylocking inserts are an easily installed thread assembly that is ideal for replacing damaged or worn threads in virtually any material – ferrous, non-ferrous and non-metallic.

They are constructed from high quality carbon steel or extremely hard wearing stainless steel. One piece loksert inserts are supplied with the dove-tailed locking keys pre-assembled. Lokserts are suitable for repairing and creating threads in a wide range of applications including forgings and castings and are especially suited to situations that experience heavy wear and vibration - such as mining, construction and earthmoving equipment.

Features and Benefits

- Solid bushing utilising locking keys provides positive mechanical lock against rotation
- High strength and reliability provides maximum pullout strength
- Installed using standard drills and taps
- Simple installation - no special skills required
- Suitable for use in a wide range of parent materials
- Impossible to cross thread during installation
- Simple removal process if required
- No tang to break and remove
- Available in metric sizes, inch sizes and spark plug sizes
- Available in Miniature, Thinwall, Heavy Duty, Extra Heavy Duty and Solid. Stainless steel inserts are also available in wide range of internal thread locking sizes.

tapsert®

Tapsert self cutting threaded inserts feature both external and internal threads. They are driven into a pre-formed or pre-drilled retaining hole and the cutting slots (or cutting bores) effectively tap the hole as the insert is wound into the parent material.

Tapsert inserts are available in case hardened steel or stainless steel.

Tapsert inserts are ideal for use in low shear strength materials (such as alloys, plastics and castings) which require threaded seats with high load capacity and wear resistance.

Tapsert inserts feature:

- High pull-out strength
- High loading capacity in low shear strength materials
- Wear free, vibration resistant screw joint
- Pre-cast or pre-drilled holes with standard tolerance
- No requirement for thread tapping tools
- Retains and captures chips from installation in chipping reservoirs.

bondsert®

Bondsert inserts provide a stronger fastener assembly in soft materials such as aluminum, magnesium and even cast iron. They can be used for repairing stripped threads, and for use in creating stronger threads in original equipment. They are available in carbon steel and 303 stainless steel.

Bondsert external threads are manufactured with standard size and pitch to permit the use of standard drills and taps. Bondsert inserts

can be installed with a screwdriver, bolt/jam nut, or optional power drive tool.

Bondsert inserts are vibration resistant. Immediately upon installation, micro-encapsulated adhesive begins to set, and the newly installed inserts are fastener-ready in 3-5 minutes and will not back out.

The adhesive seals against liquids and gases up to 6,000 psi when fully cured after 72 hours.

Manufactured from high quality chromium nickel stainless steel, PowerCoil Wire Thread Inserts provide high strength internal threads that resist the effects of temperature and corrosion. Their unique design ensures superior threads whose compound performance cannot be reproduced by any other single fastening method. Available in two basic forms, free running or screw locking, they are much lighter and less expensive than any other equivalent type of thread insert and because of their compact size they can generally be incorporated into existing designs where no previous provision has been made.

FREE RUNNING

Produced from precision profiled austenitic stainless steel wire wound into a helical spiral, PowerCoil free running inserts have a spring like appearance. When installed, using any one of a variety of manual or automatic tools, they provide strong permanent internal threads which resist heat and corrosion. Once fitted, their position is maintained by the action of radial pressure between their coils and the flanks of the tapped hole. This pressure exists because their free diameter is larger by a calculated amount, than their installed diameter.

SCREW LOCKING

Screw locking (or prevailing torque) inserts are of particular value in applications subject to the effects of cyclic vibration or impact. In addition to the benefits afforded by free running inserts, PowerCoil screw locking inserts offer the additional security of prevailing locking torque. This is achieved by the action of one or more polygonal grip coils positioned within the insert's length, which exert radial pressure on the male thread. Each grip coil consists of a number of tangential locking chords which protrude inside the minor diameter of the normal free running coils. As the male thread passes through these grip coils, the locking flats are displaced thus exerting radial pressure or prevailing torque on the male thread. On removal of the male thread, the locking coils relax to their original form permitting repeated assembly whilst retaining a measurable level of prevailing torque.

Note: It is recommended that only close fit plated or lubricated bolts or screws are used with screw locking inserts.

FEATURES & BENEFITS

For many years, helically coiled wire thread inserts have been vastly underestimated. The popular misconception that they were designed for the repair of damaged threads has given this unique fastener a false image.

They are much lighter and less expensive than any other equivalent type of thread insert and because of their compact size, can generally be introduced into existing designs where no previous provision has been made. Unlike many other economic measures, their introduction increases quality and performance whilst reducing overall product cost. Their introduction may result in the use of thinner sections or lighter parent materials without sacrificing thread strength.

They protect tapped threads against failures due to stripping, seizing, corrosion and wear. PowerCoil wire thread inserts are produced from austenitic stainless steel wire which is work hardened to a tensile strength above 200,000psi and a hardness of Rc43-50. The inserts have an exceedingly smooth surface finish which virtually eliminates friction-induced thread erosion.

The continuous helically coiled design negates the need for thick wall structures to support the internal and external threads - the diamond profile wire coil is the thread. PowerCoil wire thread inserts can be installed in reduced size bosses or flanges

and within constricted areas – saving space and weight while providing high strength.

A boss radius equal to the nominal bolt diameter is usually sufficient.

A complete range of installation tools are available to suit specific production techniques. A range of hand tools exist for small runs and repairs; electric and pneumatic tools are available for high volume production requirements.

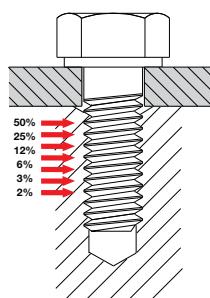

STRENGTH

Due to their flexibility, wire thread inserts create internal threads which have a much improved distribution of residual stress loading when compared with conventional tapped holes, where 75% of the shearing forces are carried by the first three threads in the tapped hole. The flexibility of wire thread inserts helps to compensate for pitch and flank angle errors, inherent in normal tapped holes, and significantly enhances the load bearing capacity by deflecting the residual forces into a helical hoop stress which is dispersed into the wall of the tapped hole. This enables the design to be confidently based on the bolt strength utilising smaller and shorter threads even when used in low strength materials.

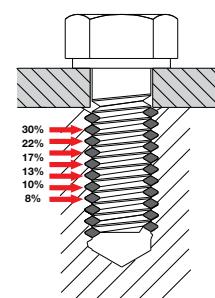

The high tensile coils of a wire thread insert undergo a diameter reduction during installation. The outward spring-like force of the coils "locks" the insert into place.

Each coil can flex independently to contact the greatest amount of parent material thread surface. Both static and dynamic load bearing capabilities are improved.

Standard Bolt

Bolt with PowerCoil insert

ELIMINATE STRESS

Virtually no stress is introduced into the parent material because there is no staking, locking, swaging or keying in place. The outward "spring action" of the insert holds it in place.

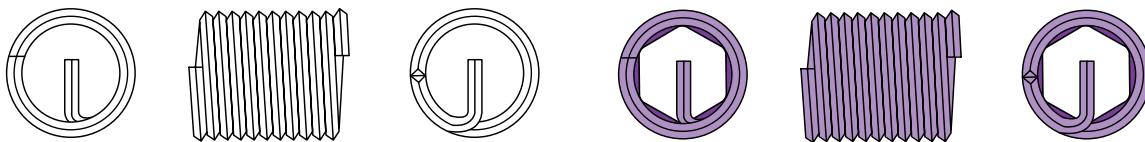

WEAR RESISTANCE

The combination of material hardness and the brilliant surface finish of wire thread inserts creates internal threads in which wear due to thread friction is virtually eliminated. This is of particular value in applications requiring repeated assembly and disassembly. The low frictional coefficient ensures that virtually all of the applied assembly torque is converted into clamping load. Thus providing threads that stay tight.

CORROSION PROTECTION

The 18/8 austenitic stainless steel wire used in PowerCoil inserts resists corrosion under normal environmental conditions. Galvanic action within the thread assembly is reduced, increasing the life of the fastening assembly.

Galvanic corrosion is most significant form of corrosion affecting

inserts and fasteners. Galvanic corrosion occurs when dissimilar metals are in contact in the presence of an electrolytic solution. All metals exhibit different degrees of "activity" or "nobility" and can be arranged in a galvanic series of increasing activity. Gold and platinum are most noble while zinc and magnesium are most active. The most common electrolytic solution encountered is ordinary water. Seawater or salt spray is more damaging because of high concentrations of dissolved salts.

The best way to preclude galvanic corrosion is to use similar potential metals and eliminate the electrolyte conductor. The active stainless steel of PowerCoil wire thread inserts are not passivated. This minimizes the possibility of galvanic corrosion occurring when they are installed in aluminum or magnesium parent materials.

Some additional precautions for reducing galvanic corrosion are:

1. Isolate the fasteners from the electrolyte. This can be done through gasketing or sealing.
2. Specify cadmium plated inserts. The cadmium plate provides a sacrificial barrier against corrosion. In addition, the cadmium plate has lubricating properties that minimize galling when stainless steel screws are used.
3. Apply corrosion inhibiting pastes or compounds to the screw. These include zinc chromate primer (MIL-P-8585) and strontium chromate primer (MIL-P-23377). Note: Pastes applied to the PowerCoil Thread Insert can become trapped between the wire and the hole and cause loss of proper tolerance. It is therefore recommended to apply the paste only to the screw, not the insert. If zinc chromate primer is applied to the tapped hole it should be thinned and applied sparingly. The insert should be installed while the primer is still wet.
4. Specify a dry film lubricant such as molybdenum disulphide on the inserts. This provides a secondary barrier against corrosion.
5. Where practical or where it will not interfere with the completed assembly, the external joint should be coated with a suitable paint.

MATERIALS

PowerCoil standard inserts are manufactured from fully certified, aircraft quality, 304 (18/8) austenitic stainless steel in accordance with DTD 734A. Alternative materials include 316 stainless steel and a variety of application specific surface coatings.

ALTERNATIVE MATERIALS

Phosphor Bronze

Non ferrous copper/tin alloy in accordance with BS2783 PB 102 EH – is suitable for operation in temperatures ranging from -200°C to +300°C.

Inconel X-750

Heat resisting precipitation hardenable nickel base alloy (equivalent specifications SAE AS 7246, DIN/NF 3018, W.NR 2.4669, UNS N07750). Inconel X-750 is suitable for operation in temperatures ranging from -200°C to +550°C.

Nimonic 90

Heat resisting precipitation hardenable nickel base alloy in accordance with BS2 HR 501 (equivalent specifications W.NR 2.4632, UNS N07090).

Nimonic 90 is suitable for operation in temperatures ranging from -100°C to +650°C.

Insert Material	Max. Temp. Peak Cont.	Typical Applications	Coatings
Stainless 304	425°C 315°C 800°F 600°F	Most general applications in all materials	FL, AG, CD
Stainless 316	425°C 315°C 800°F 600°F	Increased corrosion resistance for salt water applications	FL, AG, CD
Phosphor Bronze	300°C 235°C 572°F 455°F	Copper parts, non-magnetic, low permeability applications	AG, CD
Inconel X-750	650°C 550°C 1200°F 1020°F	Aerospace, turbines, corrosive environments, high temp. use	AG
Nimonic 90	650°C 550°C 1200°F 1020°F	Aerospace and turbine applications	AG

ALTERNATIVE FINISHES & COATINGS

Cadmium Plate

Electro-deposited Cadmium in accordance with DTD 904/Def Stan 03-19 (equivalent specifications FED. QQ-P-416, LN 9368). Cadmium plating provides an excellent barrier between dissimilar metals dramatically reducing the effects of galvanic corrosion, its high lubricity and excellent corrosion resistance prevents seizure and galling between threaded components. Cadmium plate is suitable for operation in temperatures ranging from -200°C to +235°C.

Cadmium plated parts must not be

- subjected to temperatures exceeding 235°C (455°F)
- come into contact with fuel or hot oil
- come into contact with food or drinking water
- be used with titanium components (either directly or indirectly). At elevated temperatures embrittlement and subsequent component failure may occur.
- Cadmium is highly toxic – consequently extreme care must be taken when shipping, handling and installing.

Zinc Plate

Electrolytically deposited zinc in accordance with BS 3382. Electro-deposited zinc is the most widely applied electroplated finish in industry. Zinc is suitable for operation in temperatures ranging from -200°C to +250°C.

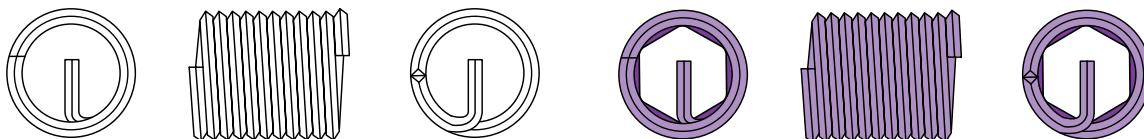

Silver Plate

Electrolytically deposited silver in accordance with DTD 939. Silver plating is used to prevent seizure and galling between thread components in high temperature applications and is most commonly applied to aero-engine fasteners. Silver plate is suitable for operation in temperatures ranging from -200°C to +650°C. Silver plated wire inserts may be installed in various materials including aluminium alloys, magnesium alloys, corrosion and heat resistant materials etc.

Silver plated inserts are not recommended for installation in titanium alloy which may exceed a service temperature of 300°C (570°F). Stress corrosion as a result of the combination of silver and titanium may occur in the housing material.

Dry Film Lubricant

Solid film heat cured molybdenum disulphide dry film lubricant coating in accordance with MIL-L-0046010 provides a low frictional coefficient coating with excellent load bearing capabilities. Dry film lubricant prevents seizing and galling between threaded components and is particularly effective in screw locking insert applications. Dry film lubricant is suitable for operation in temperatures ranging from -100°C to +250°C.

Plating / Finish	Part No.	Suffix	Applicable Process Specification
Silver Plating	AG		DTD 939
Cadmium Plating	CD		QQP-416 or DEF STD 03-19
Dry Film Lubricant	FL		MIL-L-8937 or MIL-L-46010
Red Dye	-		Applied to locking inserts for identification purposes*

* other colour dyes may also be utilised for specific identification purposes

SELECTION OF CORRECT INSERT LENGTH

PowerCoil wire thread inserts are available in all popular thread types. Five insert lengths are available for each thread size. It is important to select the correct insert length in order to balance the bolt tensile strength against the shear strength of the parent material. The five insert lengths (recommended thread engagement of the PowerCoil wire thread insert), 1D, 1.5D, 2D, 2.5D and 3D are shown in the shaded area of the table below. These are calculated numbers since the inserts cannot be measured in the free (un-installed) state. The numbers are multiples of the nominal thread size, or diameter, of the insert. The actual insert lengths in the installed position are listed in the insert selection tables. There they represent the actual installed length plus 1/2 pitch. Using the table below, an insert length can be selected which will produce a thread system strong enough to fracture a bolt before it will strip or damage either the parent material or the insert.

Recommended Nominal Insert lengths Based on Parent Material Versus Bolt Material Strengths

UNIFIED (source BS7752 Part 1:1994)

Parent Material (KSI)	Bolt Material Minimum								
	54	75	96	108	125	132	160	180	220
10	2.0	2.5	3.0	3.0	—	—	—	—	—
15	1.5	1.5	2.0	2.5	2.5	3.0	—	—	—
20	1.0	1.5	1.5	2.0	2.0	2.0	2.5	3.0	3.0
25	1.0	1.0	1.5	1.5	1.5	2.0	2.0	2.5	2.5
30	1.0	1.0	1.0	1.5	1.5	1.5	2.0	2.0	2.5
40	1.0	1.0	1.0	1.0	1.0	1.5	1.5	1.5	2.0
50	1.0	1.0	1.0	1.0	1.0	1.0	1.0	1.5	1.5

EXAMPLE: If parent material shear strength is 10KSI and the bolt tensile strength is 54 KSI, the correct insert length is 2.0 diameters (2D).

METRIC

Parent Material (MPa)	Bolt Material Minimum							
	300	400	500	600	800	1000	1200	1400
70	1.5	2.0	2.5	2.5	—	—	—	—
100	1.0	1.5	1.5	2.0	2.5	3.0	—	—
150	1.0	1.0	1.5	1.5	2.0	2.0	2.5	3.0
200	1.0	1.0	1.0	1.0	1.5	1.5	2.0	2.5
250	1.0	1.0	1.0	1.0	1.0	1.5	1.5	2.0
300	1.0	1.0	1.0	1.0	1.0	1.5	1.5	1.5
350	1.0	1.0	1.0	1.0	1.0	1.0	1.5	1.5

EXAMPLE: If parent material shear strength is 150Mpa and the bolt tensile strength is 600Mpa, the correct insert length is 1.5 diameters (1.5D).

BOLT PROJECTION

PowerCoil wire thread inserts are designed to be used with standard, readily available bolts and screws that require no special hardware.

The bolt must engage the entire insert length to achieve maximum assembly strength. To ensure against partial engagement, it is recommended that the tang always be removed. This will also guarantee that the locking coil(s) will be engaged by the full threads of the bolt. If design parameters prevent this, contact PowerCoil for assistance.

NOTES:

1. Bolt tensile strengths are specified minimums. When choosing an insert length, consideration should be given to the maximum tensile strength allowed by the bolt drawing or procurement specification.
2. Service temperatures can cause significant variations in strength values, therefore compensation should be allowed.
3. The importance of shear values should be kept in mind because the parent material is subject to shearing stress near the major diameter of the tapped threads.
4. When the strength values fall between two values in the tables, use next lower material shear value, or the next higher bolt tensile strength value.
5. To achieve maximum strength, bolt length and thread length as well as full tapped thread depth must be sufficient to assure full thread engagement over the entire length of the insert.

SCREW LOCKING (PREVAILING TORQUE) INSERTS

Screw Locking PowerCoil wire thread inserts are designed for applications subject to the effects of cyclic vibration or impact. The screw locking insert exerts a prevailing torque on male threaded fasteners to prevent loosening due to vibration or impact. They eliminate the need for other, less desirable and costly locking mechanisms. They are excellent in "adjusting screw" applications by preventing the male fastener from creeping.

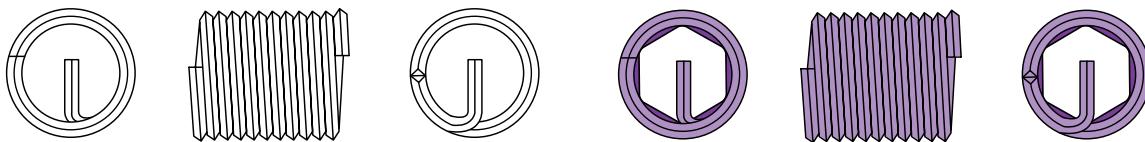

HOW SCREW LOCKING INSERTS WORK

PowerCoil Screw Locking inserts offer the additional security of prevailing locking torque. This is achieved by the action of one or more polygonal grip coils positioned within the insert's length, which exert radial pressure on the male thread. Each grip coil consists of a number of tangential locking chords that protrude inside the minor diameter of the normal free running coils. As the male thread passes through these grip coils, the locking flats are displaced and exert radial pressure (prevailing torque) on the male thread.

On removal of the male thread, the locking coils relax to their original form permitting repeated assembly whilst retaining a measurable level of prevailing torque.

Please note:

It is recommended that only close fit plated or lubricated bolts or screws are used with screw locking PowerCoil wire thread inserts. When using heat treated unplated or stainless steel bolts, an anti-seize compound, e.g., molybdenum disulfide, must be used in order to minimize galling and assure maximum cycle life. Wear life of screw or bolt using PowerCoil screw locking wire thread inserts can also be improved by specifying dry film lubrication or cadmium plating.

LOCATION OF LOCKING COILS

For 1D, 1.5D, and 2D diameter lengths: The center of the locking coil (or coils) equals 1/2 the number of free coils. For 2.5D and 3D diameter lengths: The locking coil is located the same distance from the tang as 2D length inserts.

Screw locking inserts are dyed red for easy identification purposes only. It is alcohol soluble and can be removed if desired.

RED DYE COATING

PowerCoil screw locking inserts are generally colour coded with an organic red dye for identification purposes. The dye does not affect the installation or performance of the insert and does not need to be removed (in most situations). In situations requiring extreme cleanliness (such as assembly of precision instruments in clean room conditions) the dye may be removed by soaking the inserts in a denatured alcohol solution prior to installation.

Note: It is also essential that the bolt fully engages all insert coils for maximum strength.

PowerCoil screw locking inserts can be designed to suit a customer's specific needs. In certain instances and applications prevailing torque can be lessened or increased to cater for a specific application. In these situations please contact your PowerCoil representative to discuss your specific requirements.

Please Note: Installation of PowerCoil screw locking inserts requires the use of a pre-winder tool. Please discuss other installation options with your PowerCoil agent.

MC

IMPORTANT

It is recommended that when repairing the thread on spark plug ports that you remove the head.

If you do not remove the head it is essential that you protect the engine from the ingress of chips and swarf generated by the tapping process.

STI Pilot Nose Taps are used to repair damaged threads and do not require the drilling of a pilot hole.

These taps use the existing thread as a guide in tapping a straight hole. STI Pilot Nose Taps are most commonly used to tap holes for the repair of spark plug threads.

* Tapping drill not included in thread repair kit.

Some large repair kits over 24mm may be supplied with HIM tools (hex installation mandrels) in place of HIT tools (hand installation tools).

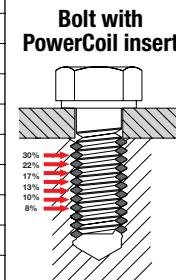

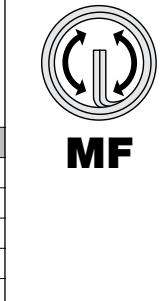

Bulk Free Running Inserts
Page 26

In a conventional threaded joint
75% of the load is placed on the first
three threads.

The helical coil
design of the
PowerCoil Wire
Thread Insert
allows the shear
loading to be
transformed into
a more desirable
radial loading (hoop
stress) over the
entire length of
the insert.

Use of a PowerCoil
insert results in
a far stronger
thread than can
be obtained by
using conventional
drilling or tapping.
Improved strength
allows designers
to select fasteners
based on minimum
bolt strength and
allows the use of
smaller diameters
and thread lengths
- even in
magnesium
and aluminium
alloys.

Screw Locking Wire Thread Inserts

Screw locking (or prevailing torque) inserts are of particular value in applications subject to the effects of cyclic vibration or impact. In addition to the benefits afforded by free running inserts, PowerCoil screw locking inserts offer the additional security of prevailing locking torque. This is achieved by the action of one or more polygonal grip coils positioned within the insert's length, which exert radial pressure on the male thread. Each grip coil consists of a number of tangential locking chords that protrude inside the minor diameter of the normal free running coils. As the male thread passes through these grip coils, the locking flats are displaced thus exerting radial pressure or prevailing torque on the male thread. On removal of the male thread, the locking coils relax to their original form permitting repeated assembly whilst retaining a measurable level of prevailing torque.

Note: It is recommended that only close fit plated or lubricated bolts or screws are used with screw locking inserts.

PowerCoil Installation and Extraction Tools

HIT Hand Installation Tool

The most flexible and cost effective installation tool for small volume applications – free running inserts only.

TB Tang Break Tool

Used to break the tang off inserts up to M13 or 1/2". Over these sizes and up to M24 or 1" the HIT tool is used to both install and break the tang.

RT Removal Tool

A quick and simple way to remove inserts up to M36 or 1.1/2" in diameter.

MIT Machine Installation Tool

1/4" hex shank tool suitable for use with electric and cordless tools. Ideal for medium volume installation using bulk free running and screw locking inserts.

HIP Hand Installation Prewinder Tool

For simplified installation of bulk free running and screw locking inserts in low to medium volume applications.

HIP tools are ideal for installing MIL spec inserts.

STB Spring Loaded Tang Break Tool

Spring loaded tang break tools increase the efficiency of the tang break procedure in medium to high volume applications.

MIP Machine Installation (Front End Assemblies) – Pneumatic

The use of Front End Assemblies (nozzle and mandrel combination) with Pneumatic Tools provides maximum efficiency in high volume applications when using strip feed free running and screw locking inserts.

Front End Assemblies (MIP) include the Mandrel (MIPM), Nozzle (MIPN), spacers to suit 1.0D, 1.5D and 2.0D inserts plus a set of shim washers for fine adjustment of installation depth.

Pneumatic Wire Thread Installation Tools and Front End Assemblies Overview

Detailed instructions are included with every Pneumatic Tool and Front End Assembly.

You will need

- A front-end assembly appropriate to the Wire Thread Inserts you wish to install and the applicable pneumatic tool.
- An air supply providing air pressure up to 100psi (7 bar) incorporating a filtered and lubricated air regulator. Your air supply should also incorporate an isolating switch to stop the air supply to the tool and connectors/couplings.
- PTFE tape should be wound around the threaded end of the air connector prior to screwing into air tool to ensure a good seal.
- If a tool is to be used with a work arm assembly please ensure that the instructions supplied with that equipment are read in conjunction with these instructions.

Front-end assembly

The front-end assembly is used in conjunction with the pneumatic installation tool to aid the installation of Wire Thread Inserts. The front-end assembly winds a mandrel through the insert (1.0D, 1.5D or 2.0D) and through the pre-winder nozzle. When the insert emerges from the nozzle the diameter has been reduced (pre-wound) to facilitate easy entry into the prepared and threaded hole in the parent material.

The front-end assembly consists of two main components

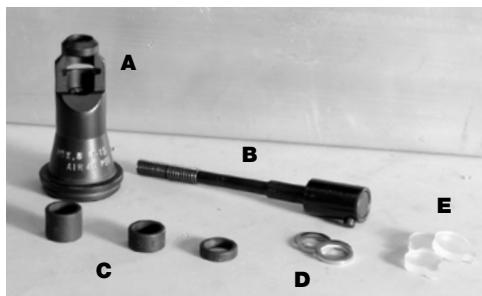

- Nozzle
- Mandrel

Three different mandrel types are used depending on the size of the inserts being installed.

Check that the front-end assembly pack also contains 2 or 3 thickness spacers (to suit different length inserts) and at least 3 shim washers. Wire Thread Inserts should be installed 3/4 to 1-1/2 pitches below the surface of a countersunk hole or 1/4 to 1/2 coil below the surface of a flush hole. The Wire Thread Insert must be fully engaged with the thread in the hole throughout its length.

Separate mandrel from nozzle by rotating the mandrel anti-clockwise until the mandrel disengages. You can now assemble the correct combination of spacers and shims (if necessary) between the clutch seat and nozzle.

Identify the length of the insert to be installed and select spacers to adjust insertion depth eg: for 1.0D inserts select the longest spacer - the longer the insert the shorter the required spacer. Once the spacers and shims have been positioned on the shaft of the mandrel lubricate the mandrel thread with light machine oil and wind the mandrel through the nozzle. Locate the mandrel pin in the slot of the driving spline (inside the adaptor case) and slide the front end assembly into the case. Tighten the retaining ring (anti-clockwise) finger tight only - over tightening will restrict free movement of the mandrel, possibly resulting in damage. **The mandrel should always be wound through the nozzle so that the threaded section is fully disengaged prior to assembling the tool.**

A Nozzle
 B Mandrel
 C Thickness spacers
 D Shim washers
 E Cushions
 (for use in the adaptor of an ARO® brand pneumatic tool only)

Front end assembly with longest spacer to suit 1.0D insert.

Front end assembly with longest spacer to suit 1.0D insert and shim washer.

Finished front end assembly with mandrel wound through the pre-winder nozzle.

Locate mandrel pin in the slot of the driving spline and slide the front end assembly into the case.

Ensure the front end assembly insert chamber opening is aligned with the trigger of the air motor. Final adjustments may still need to be made (using shim washers) to ensure that the inserts are installed to the optimum depth.

Recommended air pressures

INSERT TYPE	SOLID KEYLOCKING
INSERT MATERIAL	CARBON STEEL
STYLE	THIN WALL

**Loksert Features
and Benefits**

Solid bushing utilising locking keys provides positive mechanical lock against rotation.

High strength and reliability provides maximum pullout strength.

Installed using standard drills and taps.

Simple installation - no special skills required.

Suitable for use in a wide range of parent materials.

Impossible to cross thread during installation.

Simple removal process if required.

No tang to break and remove.

Available in metric sizes and inch sizes.

Available in Thin Wall and Heavy Duty.

**loksert®****INSTALLATION****1 DRILL**

Drill to clear the damaged thread with a standard twist drill. Chamfer the hole with a standard countersink (82° - 100°)

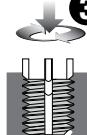

Note: Drill is oversize to accommodate external thread. Check technical charts for correct drill sizes.

2 TAP

Create new thread using a standard tap. Check technical charts for correct tap size.

Note: Use of a suitable lubricant is essential during all tapping procedures.

3 INSERT

Screw the insert into the threaded hole until slightly below the surface of the parent material.

4 DRIVE

Select the correct size installation tool and place over the insert. Drive locking keys down using several hammer taps on end of installation tool.

Products listed with POA pricing are not standard inventory items and lead times may apply.

CLAM SHELL

Tapserts

Tapserts are self cutting threaded inserts that feature both external and internal threads. They are driven into a pre-formed or pre-drilled retaining hole and the cutting slots (or cutting bores) effectively tap the hole as the insert is wound into the parent material.

Tapserts are ideal for use in low shear strength materials (such as alloys, plastics and castings) which require threaded seats with high load capacity and wear resistance.

Tapserts feature:

High pull-out strength

High loading capacity in low shear strength materials

Wear free, vibration resistant screw joint

Pre-cast or pre-drilled holes with standard tolerance

No requirement for thread tapping tools

Retains and captures chips from installation in chipping reservoirs.

tapsert®

INSTALLATION

Drill hole to recommended size as shown in the selection table.

Thread the Tapsert on to the bolt ensuring the slot side is down. The insert should be flush with the end of the bolt.

Thread the nut down the bolt until it sits firmly against the top of the Tapsert.

To ensure the Tapsert installation is straight apply downward pressure on the assembly.

If using an open ended wrench apply downward pressure to the bolt head whilst turning the nut to wind the Tapsert in. Alternatively if using a socket for installation apply downward pressure to the socket.

The Tapsert is installed when the nut is flush with the top of the parent material.

Loosen the nut with an open ended wrench and wind the nut and bolt assembly out of the Tapsert.

Congratulations – you have successfully created a new thread.

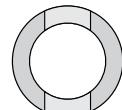

NOTE Tapping fluid should be used to aid installation.

Bondsert
Bondsert Threaded Inserts provide a stronger fastener assembly in soft materials such as aluminium, magnesium and even cast iron. They can be used for repairing stripped threads, and for use in creating stronger threads in original equipment.

External threads are manufactured with standard size and pitch to permit the use of standard drills and taps. The inserts can be installed with a screwdriver, bolt/jam nut, or power drive tool.

Bondsert inserts are vibration resistant. Immediately upon installation, micro-encapsulated adhesive begins to set, and the newly installed inserts are fastener-ready in 3-5 minutes and will not back out.

The adhesive seals against liquids and gases up to 6,000 psi when fully cured after 72 hours.

BORDO
INDUSTRIAL TOOLS

MINI KIT 1044

U.S. pat. No. 6,544,127
Patented in other countries
& PAT. PEND.

INTERNAL

For internal aluminum threads
plastic pads must be used.
Use the pads for threads bigger than 11mm (7/16")

THREADMATE

NES Threadmate

ThreadMate Kits are an economical option for internal M5 - M12 external M4 - M13 and are ideal for:

Outdoor technicians

Maintenance

Workshops

Garages

Marine Repairs

Agricultural Repairs

Motorcycles

Bicycles

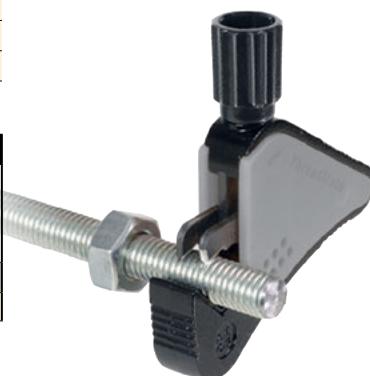

NES Threadmate tools are also available individually in convenient clam shell hang packs.

Spare blades are available in 60°, which are supplied as standard, and also 55° to suit BSW and BSF thread forms.

Threadmate kits include replaceable nylon pads to protect thread crests when restoring threads in soft metals and alloys.

Features and Benefits of NES Adjustable Thread Restoring Tools and Kits

One tool restores Metric, Imperial, Right Hand and Left Hand threads and replaces many taps or dies.

Does not require calibration.

Self adjusting to any size and pitch within tool range. Hardened HSS cutting blades for long service life.

Tool uses undamaged section of thread to guide cutting blades during repair to damaged areas.

Removes rust and burrs.

Quick to set up and simple to use.

Spare cutting blades are available in 60° and 55° flank angles.

Repairs a wide range of sizes Internal 8mm to 108mm External 4mm to 152mm

Nylon Pads

Nylon pads are available for NES 21 through to NES 24 internal tools and are to be used during the repair of threads in aluminium and other soft metals. NES Nylon Pads are produced from top quality polyamide resins which provide superior toughness, resilience and outstanding mechanical properties over a wide range of operating environments.

Optimum thread performance with Wire Thread Inserts is achieved when the inserts are installed 1/2 to 1 pitch below the surface of the tapped hole. This means that the actual length of an installed insert is equal to dimension Q less 1/2 to 1 pitch. Dimensions S and T allow for tap end clearance of intermediate taps. When using Bottoming and Spiral Flute Taps these dimensions may be reduced by an amount equal to 2 thread pitches. Any countersink depths must be added to these dimensions.

* B Major Diameter is listed for tap identification only. Slight variance of this dimension is expected and has no bearing on correct fit and tolerance of the wire thread after installation.

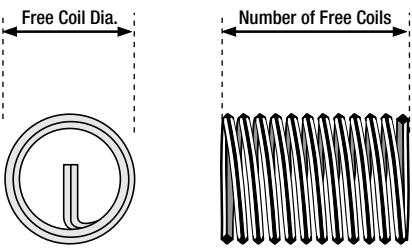

Nominal Thread Size	DRILLED HOLE DIMENSIONS							Nominal Thread Size	TAPPED HOLE DIMENSIONS							E Fitted Minor Dia. mm

IMPORTANT The success of any drilling and tapping operation is dependant upon many factors – type of material being cut, cutting speed, coolant, equipment being used – and it is not possible to give specific drill sizes for each material. Drill sizes shown are recommendations only and PowerCoil would strongly suggest that independent testing be performed for specific and critical applications.

When using wire thread inserts it is important that the drilling and tapping diameters and lengths listed below are adhered to.

The figures outlined in these tables encompass effective free coil tolerances for most globally recognized standards and manufacturers, including those of reduced diameter wire thread inserts.

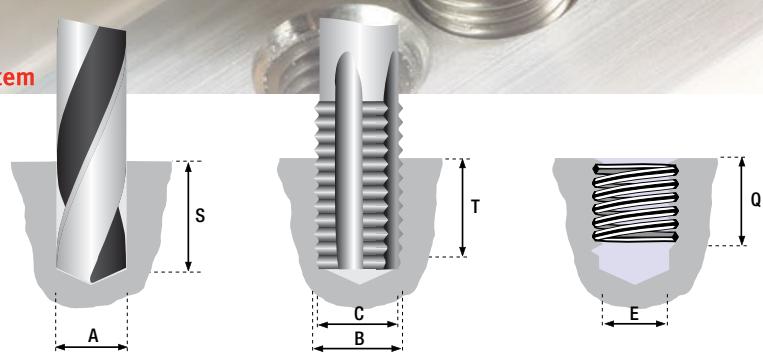

PowerCoil wire thread inserts can be manufactured to different standards upon request. Technical data on these standards can be obtained from our website – www.powercoil.com.au.

Nominal Thread Size	INSERT SPECIFICATIONS – FREE RUNNING – REDUCED DIAMETER																	Nominal Thread Size
	Q Nominal Length – installed					Free Coil Diameter		Number of Free Coils ± 1/4 coil counted 90° from Tang

Optimum thread performance with Wire Thread Inserts is achieved when the inserts are installed 1/2 to 1 pitch below the surface of the tapped hole. This means that the actual length of an installed insert is equal to dimension Q less 1/2 to 1 pitch. Dimensions S and T allow for tap end clearance of intermediate taps. When using Bottoming and Spiral Flute Taps these dimensions may be reduced by an amount equal to 2 thread pitches. Any countersink depths must be added to these dimensions.

* B Major Diameter is listed for tap identification only. Slight variance of this dimension is expected and has no bearing on correct fit and tolerance of the wire thread after installation.

IMPORTANT The success of any drilling and tapping operation is dependant upon many factors – type of material being cut, cutting speed, coolant, equipment being used – and it is not possible to give specific drill sizes for each material. Drill sizes shown are recommendations only and PowerCoil would strongly suggest that independent testing be performed for specific and critical applications.

When using wire thread inserts it is important that the drilling and tapping diameters and lengths listed below are adhered to.

The figures outlined in these tables encompass effective free coil tolerances for most globally recognized standards and manufacturers, including those of reduced diameter wire thread inserts.

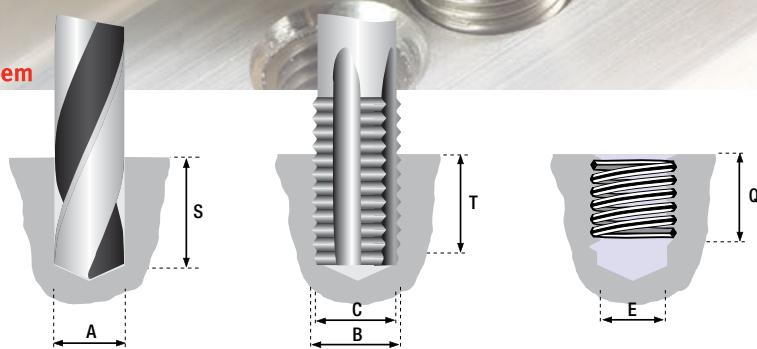

PowerCoil wire thread inserts can be manufactured to different standards upon request. Technical data on these standards can be obtained from our website – www.powercoil.com.au.

Optimum thread performance with Wire Thread Inserts is achieved when the inserts are installed 1/2 to 1 pitch below the surface of the tapped hole. This means that the actual length of an installed insert is equal to dimension Q less 1/2 to 1 pitch. Dimensions S and T allow for tap end clearance of intermediate taps. When using Bottoming and Spiral Flute Taps these dimensions may be reduced by an amount equal to 2 thread pitches. Any countersink depths must be added to these dimensions.

* B Major Diameter is listed for tap identification only. Slight variance of this dimension is expected and has no bearing on correct fit and tolerance of the wire thread after installation.

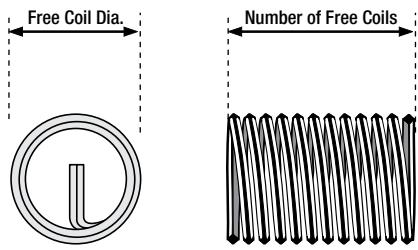

Nominal Thread Size	DRILLED HOLE DIMENSIONS										Nominal Thread Size	TAPPED HOLE DIMENSIONS										E Fitted Minor Dia.

IMPORTANT The success of any drilling and tapping operation is dependant upon many factors – type of material being cut, cutting speed, coolant, equipment being used – and it is not possible to give specific drill sizes for each material. Drill sizes shown are recommendations only and PowerCoil would strongly suggest that independent testing be performed for specific and critical applications.

When using wire thread inserts it is important that the drilling and tapping diameters and lengths listed below are adhered to.

The figures outlined in these tables encompass effective free coil tolerances for most globally recognized standards and manufacturers, including those of reduced diameter wire thread inserts.

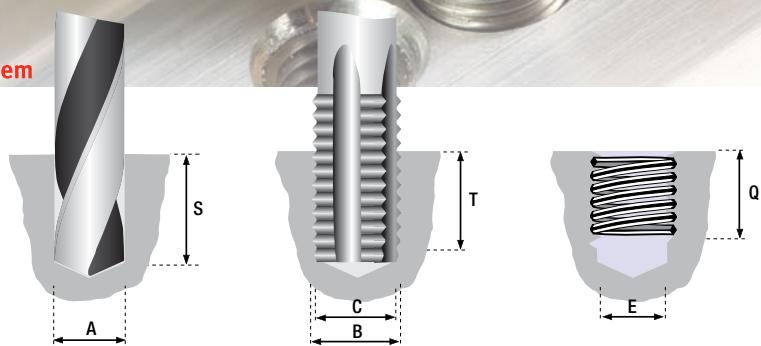

PowerCoil wire thread inserts can be manufactured to different standards upon request. Technical data on these standards can be obtained from our website – www.powercoil.com.au.

Optimum thread performance with Wire Thread Inserts is achieved when the inserts are installed 1/2 to 1 pitch below the surface of the tapped hole. This means that the actual length of an installed insert is equal to dimension Q less 1/2 to 1 pitch. Dimensions S and T allow for tap end clearance of intermediate taps. When using Bottoming and Spiral Flute Taps these dimensions may be reduced by an amount equal to 2 thread pitches. Any countersink depths must be added to these dimensions.

* B Major Diameter is listed for tap identification only. Slight variance of this dimension is expected and has no bearing on correct fit and tolerance of the wire thread after installation.

IMPORTANT The success of any drilling and tapping operation is dependant upon many factors – type of material being cut, cutting speed, coolant, equipment being used – and it is not possible to give specific drill sizes for each material. Drill sizes shown are recommendations only and PowerCoil would strongly suggest that independent testing be performed for specific and critical applications.

When using wire thread inserts it is important that the drilling and tapping diameters and lengths listed below are adhered to.

The figures outlined in these tables encompass effective free coil tolerances for most globally recognized standards and manufacturers, including those of reduced diameter wire thread inserts.

PowerCoil wire thread inserts can be manufactured to different standards upon request. Technical data on these standards can be obtained from our website – www.powercoil.com.au.

General Information for MS/NAS Style – 303 CRES Inch and Metric Lokserts:

Insert Material: 303 CRES
Key Material: 302 CRES
Finish: Passivated
Insert Tolerances: ± .010 inch or ± .25mm unless otherwise specified
Internal Threads: Inch per SAE AS8879, Metric per Fed Std H28/21, MJ Form
Keys: Inserts with an internal thread size of 5/16 or M8 and greater have 4 locking keys. Smaller sizes have 2 locking keys.

Please note that all Inch inserts conform to:

- MIL-I-45914A
- MS51830, MS51831
- NAS1394, NAS1395

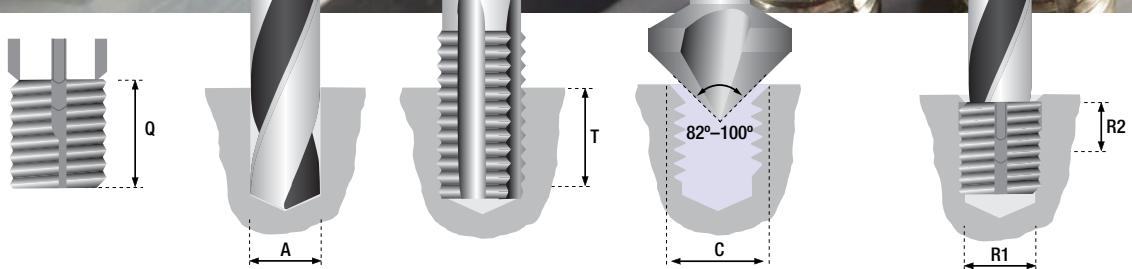

There is no National Aerospace Standard for Metric keylocking Inserts manufactured from 303CRES. Sales drawings are available upon request.

General Information for Industrial Style Carbon Steel Lokserts:

Insert Material: C1215 or equivalent
Key Material: 302 CRES or equivalent
Finish: Zinc Phosphate
Insert Tolerances: ± .010 inch or ± .25 mm unless otherwise specified.
Internal Threads: Internal Inch 3B,
Internal Metric 5H.
Keys: Inserts with an internal thread size of 5/16 or M8 and greater have 4 locking keys. Smaller sizes have 2 locking keys.

Please note that there are no industry, MS or NAS specifications with respect to carbon steel keylocking thread inserts. Sales drawings are available upon request.

loksert®

REMOVAL

1 DRILL

Drill out the material between the locking keys and the internal thread to the specified depth.

Note: Drill size and drilling depth are shown in the loksert technical tables.

2 DEFLECT

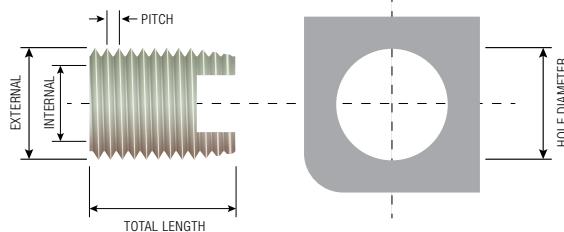

Deflect locking keys inward and break off

3 REMOVE

Remove the insert from the hole by winding it out using a screw extractor or similar type tool.

4 INSERT

A new Loksert insert of exactly the same size can be installed in the original hole.

Tapserts are self cutting threaded inserts that feature both external and internal threads. They are driven into a pre-formed or pre-drilled retaining hole and the cutting slots (or cutting bores) effectively tap the hole as the insert is wound into the parent material.

Tapserts are ideal for use in low shear strength materials (such as alloys, plastics and castings) which require threaded seats with high load capacity and wear resistance.

Tapserts feature:

- High pull-out strength
- High loading capacity in low shear strength materials
- Wear free, vibration resistant screw joint
- Pre-cast or pre-drilled holes with standard tolerance
- No requirement for thread tapping tools
- Retains and captures chips from installation in chipping reservoirs.

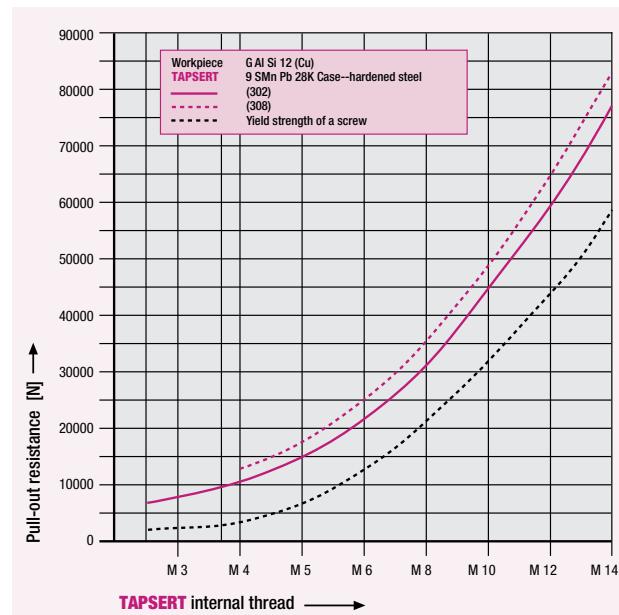

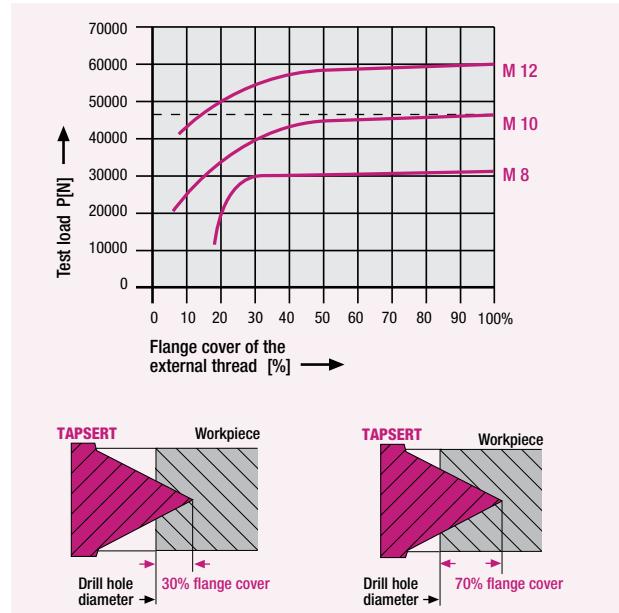

HOLE PREPARATION

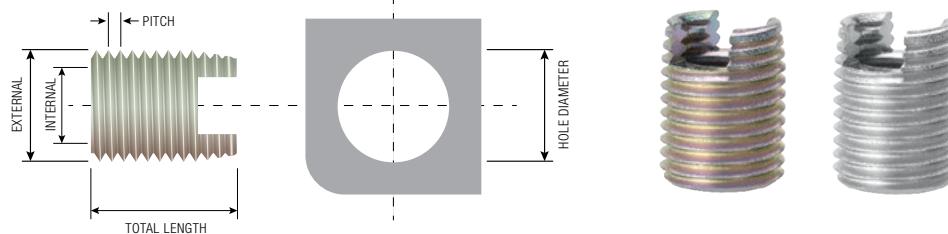

The receiving hole is drilled or pre-cast in the parent material. Generally there is no requirement to countersink the hole but it is recommended care is taken not to warp the workpiece surface when installing the insert. Tapserts must be installed at least 0.1-0.2mm below the assembly surface.

- The length of the Tapsert MUST NOT exceed the thickness of the parent material.
- The minimum hole depth is indicated in the data tables included in every kit. Alternatively these may be downloaded from the website www.powercoil.com.au
- The minimum wall thickness of the assembly is dependant on the maximum insert loads and the elasticity of the parent material.
- Detailed hole diameter information is shown on the installation leaflet included with every kit and is also available at www.powercoil.com.au. As a general guide hard materials require a larger diameter hole than softer, elastic materials. If the installed insert is being subjected to high loads it is recommended to perform material specific testing prior to production.

INSTALLATION NUT & BOLT

Screw the insert onto the bolt and nut assembly ensuring the slot side is pointing downward. Thread the nut down the bolt until it sits firmly against the top of the Tapsert. Ensure that the Tapsert is perpendicular to the workpiece and apply downward pressure on the installation assembly. Turn the bolt head to wind the Tapsert into the receiving hole. The tapsert is installed when the nut is flush with the top of the parent material. Loosen the nut and wind the assembly out of the Tapsert. Complete instructions are included in every Tapsert kit.

DRILL HOLE DIAMETER

Brittle, tough, and hard materials require a larger drill hole than soft and elastic materials. For recommended hole sizes see table above. The drill sizes in bold are the recommended diameter for easy assembly. Smaller diameters may require the use of cutting fluid during installation. When specific load performance is required we advise insert/material testing.

tapsert®

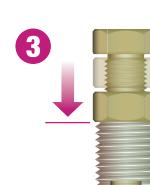

INSTALLATION

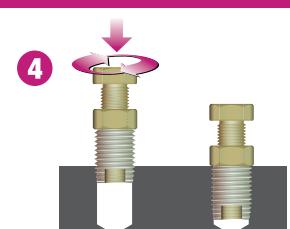

Drill hole to recommended size as shown in the selection table.

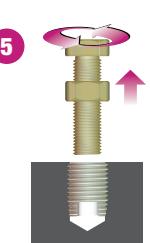

Thread the TapSert on to the bolt ensuring the slot side is down. The insert should be flush with the end of the bolt.

Thread the nut down the bolt until it sits firmly against the top of the TapSert.

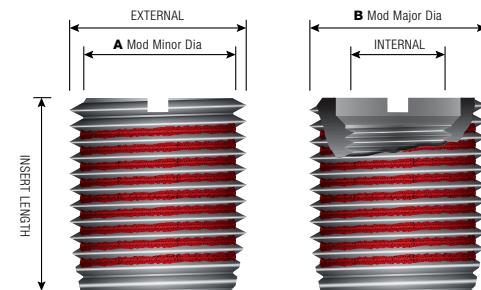

To ensure the TapSert installation is straight apply downward pressure on the assembly.
If using an open ended wrench apply downward pressure to the bolt head whilst turning the nut to wind the TapSert in. Alternatively if using a socket for installation apply downward pressure to the socket.
The TapSert is installed when the nut is flush with the top of the parent material.

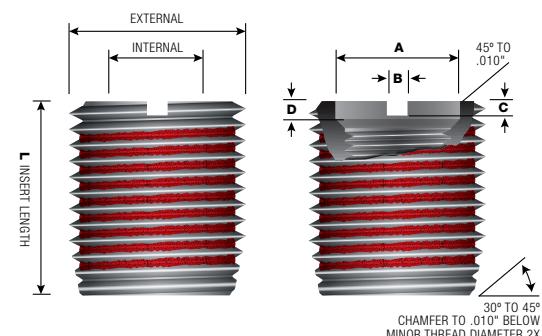

Loosen the nut with an open ended wrench and wind the nut and bolt assembly out of the TapSert.
Congratulations – you have successfully created a new thread.

NOTE Tapping fluid should be used to aid installation.
